\* CAGR = "Compound Annual Growth Rate" is a useful measure of growth over multiple time periods. It can be thought of as the growth rate that gets you from the starting value to the ending value if you assume that the amount has been compounding at a specific rate over the time period. The formula for CAGR is:

$$CAGR = \left[ \frac{\text{Ending Value}}{\text{Beginning Value}} \right]^{\frac{1}{\text{Number of Years}}} - 1$$

\*\* The "CPI x ?" row indicates how fast this tax has been increasing relative to inflation. For example, in Wilton, the Total Tax Rate has increased a 3.2 times the rate of inflation for the period covering 2007 through 2017.
